

Whitelist finale

```
# Sample URL filter file
#
# TO USE THIS FILE JUST MAKE A SIMPLE
# EDIT AND CLICK ON "SAVE" BUTTON
#
# You can either Whitelist it or blacklist the entries
#
# This is a comment
#
# STRICT - only an exact URL match will be let through.
# ALL - all pages from a specified path will be let through
# - The * wildcard will do a domain match, but only with the ALL
filter
#
# foo.org = www.foo.org
#
# JAVASCRIPT - Allow javascript to run on the page (default)
# NOJAVASCRIPT - Block javascript from running on page
# http protocol is assumed other protocols like https:// MUST be
specifically added

# SYNTAX FORMAT
# filter[HOST, ALL/STRICT, JAVASCRIPT/NOJAVASCRIPT];

# use specific protocol if not assuming http://
# eg: https://
# Most sites today are not using http:// and instead redirect to https://
# so ensure the correct protocol for the site you want to filter.
# For example you might allow www.google.com.
# which will be blocked if the https:// protocol is not set here.
